

2021 Macroeconomic Outlook: Navigating Through the Fog

BY ROBERT KLEINSCHMIDT ON *JANUARY 29, 2021*

Executive Summary:

- We should all hope 2020 was an anomaly with respect to market volatility but at the same time it represents a testament to the strength of our political institutions as well as to the creativity and ingenuity of our scientists and private sector.
- Considering all that occurred during the year from the pandemic induced collapse in economic activity in March, political uncertainty and civil unrest and challenges to democratic norms following the election in November it is remarkable that equity markets managed to achieve a positive result much less record levels.
- The most dominant factors influencing the economy and markets were the COVID pandemic and the economic and public policy responses thereto, the election in the U.S. and scientific breakthrough on several vaccine candidates.
- Fears of a bubble due to growth stocks and new issue activity are real but can be addressed with a more nuanced analysis of market constituents and economic variables
- Concentration still an issue and with greater political scrutiny so that is a risk to markets.
- Pandemic caused massive changes in economic behavior – some permanent and some perhaps temporary.

- Inequities that existed prior to the pandemic have been exacerbated and that will have long term implications.
- Inflation and rising interest rates are risks but are now consensus and seem critical to assumptions of rotation into value stocks; we are less sure for a variety of reasons.
- Modern Monetary Theory is going to take hold and that will have its ramifications.
- Overall, our sense is that between the unprecedented stimulus, roll out of multiple vaccines, pent up demand, continued low interest rates and absent inflation that markets can continue to be positive in 2021. Whether investors will be able to party like it is 1999 is another story.
- Biggest risk is perhaps inequality and how policy might respond to it; others include missteps by the new Biden administration, resurging outbreaks of COVID, inflation, interest rates and consumer credit.

“It was the best of times. It was the worst of times.” That quote from Charles Dickens’ novel A Tale of Two Cities seems to capture the events of 2020. Themes from the Dicken’s novel ?? duality, revolution and even insurrection ?? have all come into play for investors over the past year. At the beginning of 2020, most investors were focused on the strengths of the economy in terms of record low unemployment, rising wages, recently completed trade deals with China and Mexico, low interest rates and reduction in business regulation. No one did or could have foreseen the disruption of the COVID virus that was coming. Investors and the population at large continued basking in the longest economic expansion on record and the stage seemed to be set for moderate growth, stable markets and the presumptive reelection of President Trump. Indeed, if there is an economics lesson from the pre-COVID period, it is that the U.S. economy can run hotter with a stronger job market and larger fiscal deficits than previously believed without incurring starkly rising interest rates and inflation. Of course, then in late February and early March, everything changed, but those lessons will likely have important implications for the Biden administration. (see figure 1)

(Figure 1)

The year global equity markets just experienced marked near historic volatility and was characterized by geographic, socioeconomic and sectoral disparities (see figure 2). Considering the speed and severity with which markets reacted to the outbreak of COVID-19, and the initial restrictive actions of governments and private individuals and businesses, and then the gradual and arbitrary reopening and recovery, marred by fits and starts, it does seem somewhat remarkable that markets achieved a positive result at all, much less one that put all of the major indices at or near record levels.

(Figure 2)

The main reason for the strong rally from March lows in global stock markets is the prompt and massive reaction of the world's central banks which, by year's end, had pumped into their financial systems nearly \$30 trillion dollars and seemed intent to go for more as we look toward the new year. This comprehensive intervention is orders of magnitude larger than the similar actions taken during the Great Financial Crisis in 2009. Moreover, they were accompanied by significant fiscal responses from the major governments unlike what occurred in the previous global crisis. Indeed, the sum of the Fed and ECB balance sheets are up more than 70% compared with last year (see figure 3).

G-4 Central Bank Balance Sheet Forecast (per Morgan Stanley)

(Figure 3)

All this liquidity inflated global equities and other assets, but with varying results. Some of that disparity was due to the different measures taken by governments to contain the pandemic. The U.S. markets did well as represented by the S&P 500 and better than most European markets. Arguably the U.S. public and private sector authorities took a relatively more pragmatic approach regarding the trade-offs between public health with the needs of the economy. Interestingly, the dollar lost more than 8% against the Euro during the earlier period where the Europeans seemed to prioritize the health

aspect above economic concerns. However, some Asian equity markets did even better, having experienced the pandemic earlier.

Commodities, aside from oil, also benefitted from the liquidity and outperformed U.S. equities as the dollar weakened considerably (see figure 4).

(Figure 4)

Looking toward 2021 and beyond, questions linger about the longer-term impact of the pandemic and the consequences of massive monetary and fiscal intervention might have on markets, the economy and important macroeconomic variables such as interest and currency exchange rates, financial assets, commodities. As important, perhaps, or even more so, what will be the impact on politics?

For most market commentators, the emerging consensus view is continued optimism for the economy and for equities, concerns about fixed income assets due to the expected rise in inflation and a concomitant rise in yields, doubts about the strength of the dollar and therefore rising raw materials and precious metals pricing.

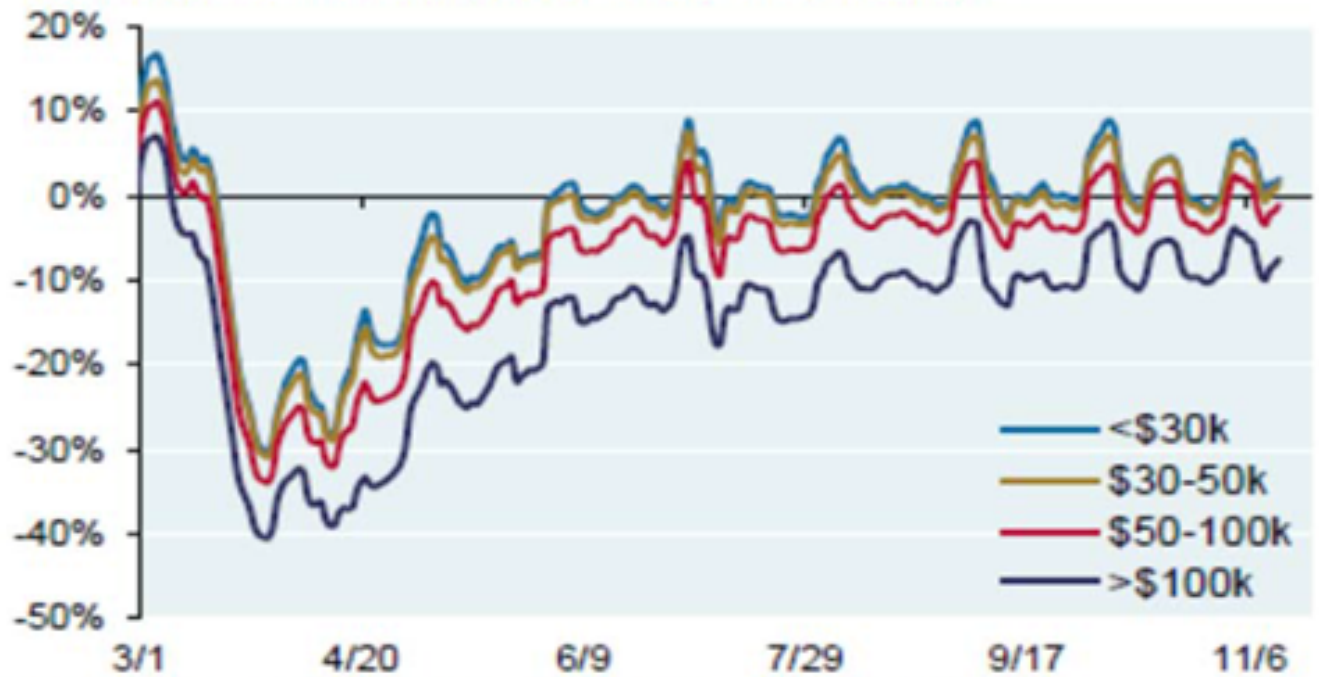

This consensus contains some inherent contradictions that merit a second look.

The first is that the sharp market rallies have already discounted a strengthening global economy.

Second, recovery in post pandemic consumption could disappoint. Most consumers have already returned to pre-pandemic levels of spending. The composition of spending may have changes, but the level is such that there is little room for mean reversion in middle and lower income level consumer spending (see figure 5).

National spending trends by income

% change from January 2020 level, 7-day average

Source: Internal Chase data, JPMAM. November 13, 2020.

(Figure 5)

Only the higher income brackets are still below where they were pre-pandemic spending levels. If spending by high income individuals recovers more it may be in categories such as travel, restaurants, and luxury goods. But upper income brackets are the ones that will be hardest hit by Biden Administration likely tax increases, so the effect may be muted.

The underlying health of the consumer economy is also misleading because there is a great deal of legally mandated mortgage and rental forbearance (see figure 6). Depending on how banks and landlords treat deferred and foregone payments will affect how quickly consumers can expand their discretionary spending.

Mortgage delinquency rates depend on treatment of forbearance plans, Delinquency rate

(Figure 6)

Also, while the scientific community has proven remarkably successful in developing vaccines to address the pandemic, the disjointed and underfunded approach to distributing the vaccines has been disappointing. Nor is there any certainty over how long the vaccine will last. Thus, optimism over the vaccine could be overdone or premature.

Finally, some observers believe that the rally has left U.S. equities overextended from a valuation standpoint. Across many metrics the current valuation of the U.S. markets is high. In prior cycles when those thresholds were reached market performance has lagged.

For all these reasons, we are wary of becoming too enamored of the prevailing consensus and continue to stress our value discipline in stock selection.
